

LED Light Panel System

Light Panel System with LED Power

Tenrod's Light Panel System comprises acrylic sheets acting as the light guide medium, printed with a light diffusing pattern for luminous consistency, and powered by high power low profile LEDs in rigid or flexible strip arrays.

Light Panels are excellent for backlighting graphic advertising posters, or logos and decals, décor "light tiles", architectural features, subtle ambient lighting, or emergency signs and annunciator systems.

These Light Panel Systems are all customised products to suit the customers' applications. Sizes, shapes and colour of light shall vary to the applications.

Standard thickness is 6mm or higher. Thinner applications are possible but will require special modifications.
